Gen AI Academy

APAC Edition

Build in APAC. Build for the world.

Participant Details

a. Participant name: Apoorva Rajendra Barapatre
b. Problem Statement: Build and deploy a single AI agent using ADK and Gemini that performs text summarization and is accessible via an HTTP endpoint on Cloud Run.

Brief about the idea

I built a text summarization AI agent using ADK and Gemini. The agent takes a paragraph as input and returns a short and clear summary in 2–3 lines. The main goal was to keep the solution simple while following proper agent structure. The agent is deployed on Cloud Run and can be accessed using an HTTP request.

Meeting the Build Criteria

- How did you navigate the requirements of your chosen track to build a custom solution - using ADK, MCP, or AlloyDB AI that effectively addresses the 'What You Must Build' criteria?

I followed the requirements by building the agent using ADK and integrating it with the Gemini model for generating summaries. I created a structured multi-agent workflow using a root agent and sequential agents for processing and formatting the response. The agent is deployed on Cloud Run and is accessible through an HTTP endpoint. This ensures that the solution meets all the given criteria of building, deploying, and exposing the agent properly.

Opportunities

- How different is it from any of the other existing ideas?
- How will it be able to solve the problem?
- USP of the proposed solution

This solution is simple but practical. Unlike complex systems, it focuses on doing one task efficiently that is text summarization.
It can be useful for students or professionals who want quick summaries of large text.
The USP is its clean agent-based architecture and easy deployment, making it scalable and easy to extend in the future.

List of features offered by the solution

- Accepts text input via HTTP request
- Generates concise summaries using Gemini
- Uses ADK-based agent workflow
- Deployed on Cloud Run
- Simple and fast response system
- Modular structure (easy to upgrade)

Process flow diagram or Use-case diagram

User sends text → Root Agent receives input → Input stored → Summarization Agent processes text → Formatter Agent structures output → Final summary returned to user

Technologies to be used in the solution

- Python
- Google ADK (Agent Development Kit)
- Gemini API
- Google Cloud Run
- LangChain (basic integration support)

Snapshots of the prototype
